

CITY OF STOCKHOLM

A Systematic Approach to Climate Protection

Since the start-up in 1995 and up until today, the City of Stockholm has worked systematically and efficiently within the field of climate protection. During this time the emissions per inhabitant of Stockholm have been reduced by around 25 % from the levels of the base year of 1990. Of crucial importance for the Stockholm success story has been the early decision to go from theory to practice; policies have been matched by concrete action to reach the overall goals. A great number of measures have already been carried out, while there are at least 50 in progress – ranging from physical investments to awareness rising – in the fields of heating, energy use, transportation and waste management.
